

Name : T. Kandan Ram

CO1 - AT 1

Reg no : 192524162

course : CSA1518 - cloud computing

80

① Deployment Models

1) Public cloud

public clouds are owned by cloud service providers who charge for the use of cloud resources.

Ex: AWS, Azure (Microsoft)
(Amazon)

2) Private cloud

The cloud infrastructure belongs to and is represented by only one organization.

Ex: OpenNebula, OpenStack.

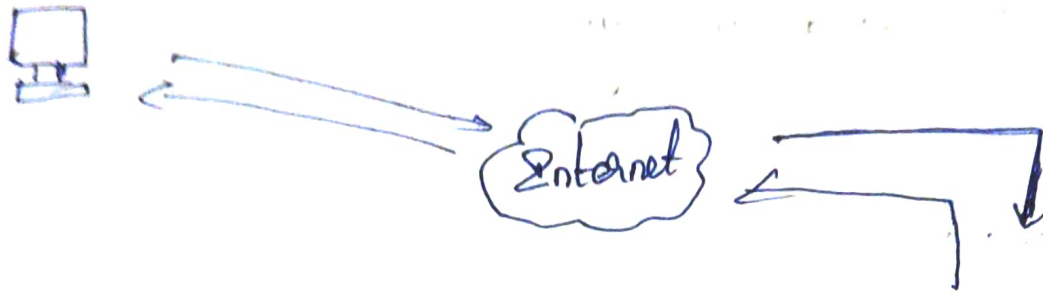

3) Hybrid cloud

The cloud infrastructure is shared by several organisations and supports a specific community that has shared concerns (eg, mission, security requirements, & compliance)

4) Hybrid Community cloud

The cloud infrastructure is a composition of two or more clouds (private, community or public) that remain unique entities but are bound together by standardized or proprietary technology that enables data & application portability.

- ③ software or mobile application which catered over the internet and used in browser through the server.

web servers. Instead of application server to process the page

sample web Applications

- Gmail web mail services
- Google calendar shared calendaring

APP creators

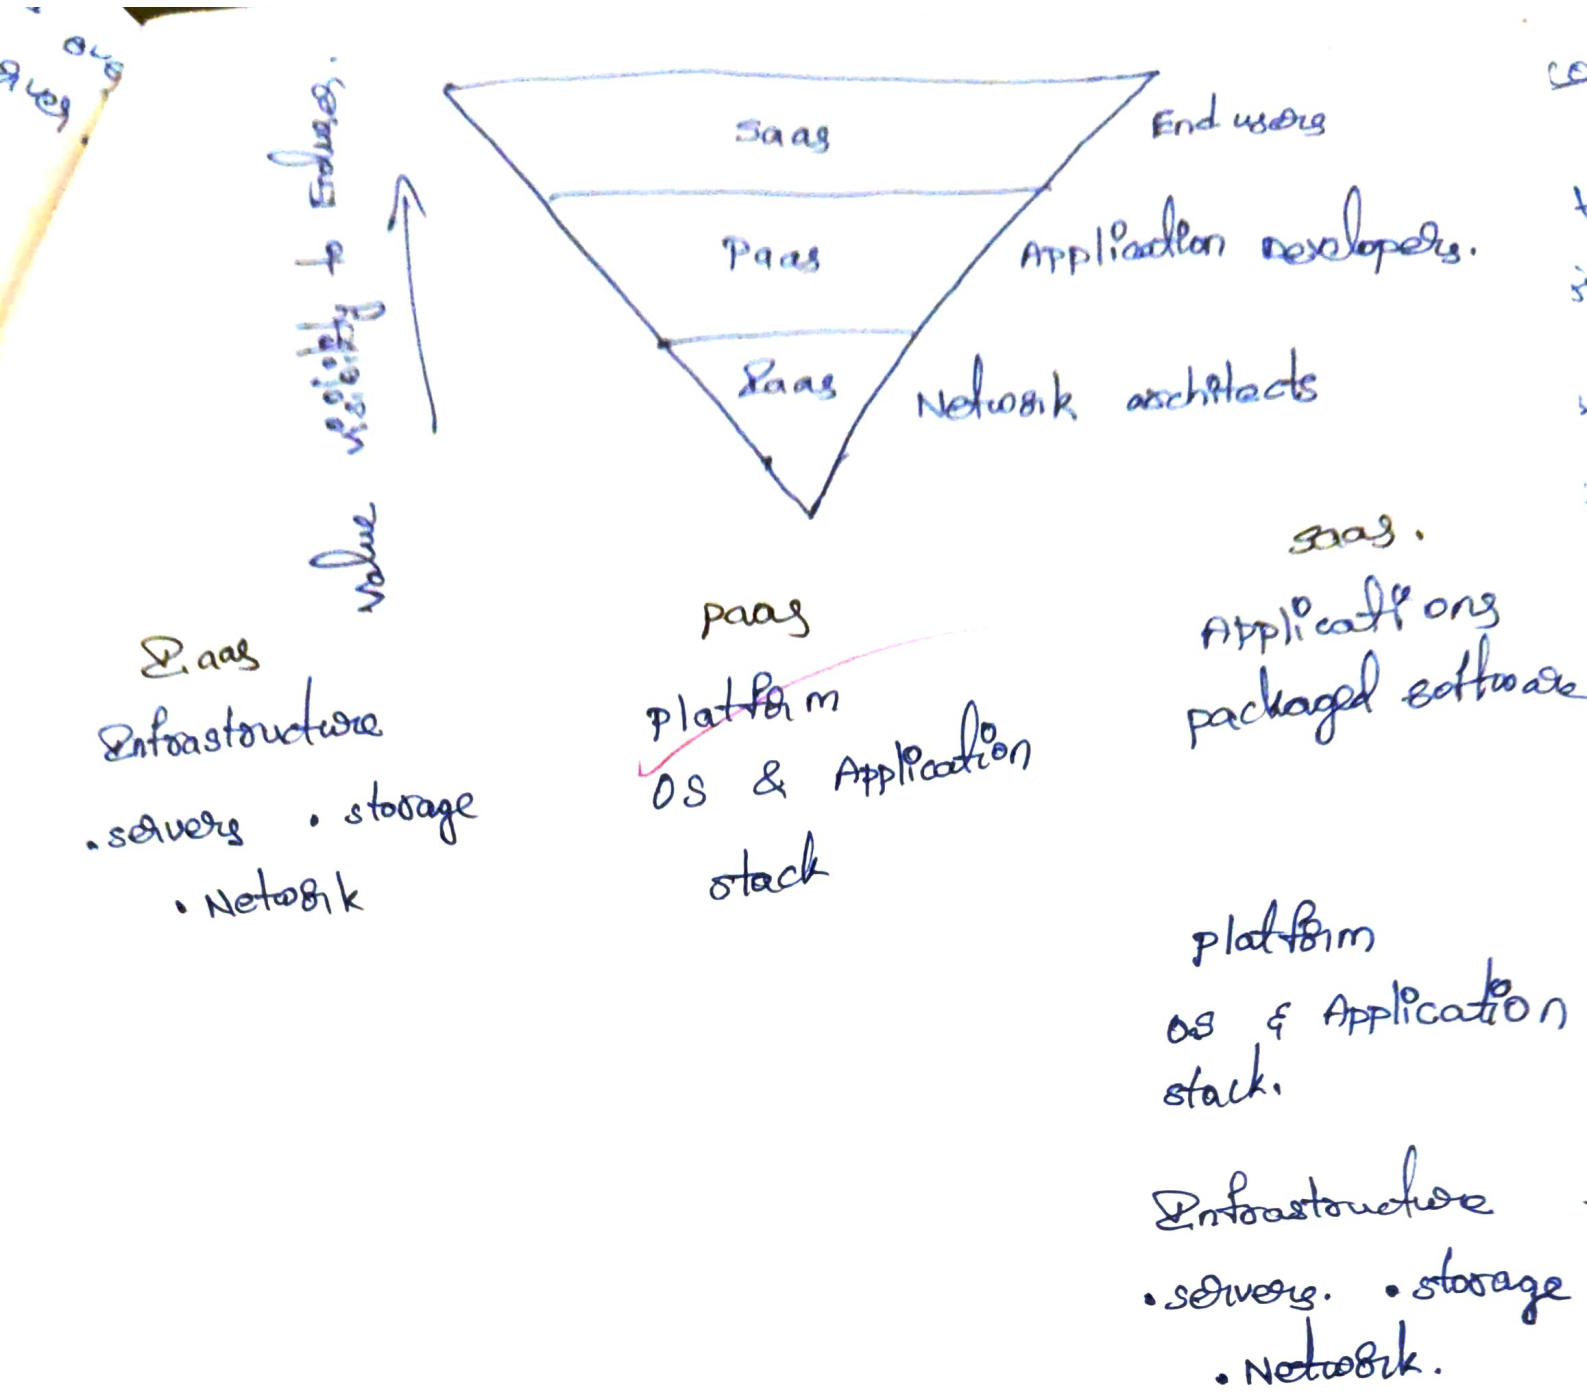

- Google gadgets
- partnership
- Apex

④ Advantages

- cloud is used to store the students, staff's, results and all works done by students and staffs.
- In Industries cloud is used to store the project details and Industrial data in it.
- It will used not only for storing it can be use for other works also.

limitations

- It requires the Authentication & Authorisation.

⑤ Resource pooling

Resource pooling means the all resources are available to everyone through one server.

- on-demand self-services means serve the services among themselves as per the requirements of the user
- due to these features all resources are available and resources are getting as per the requirements of the users so more users use that scalability

and utilization will increase.
